

Your agent applies. You just say yes.

Design review — mobile app, 14 screens, built on the Flutter feature architecture.

14

screens

6

feature modules

6 min

daily user effort

THE LOOP

Six minutes a day, and the agent does the rest.

1

Scan

214 postings read at 04:00, every night.

2

Score

Five weighted axes against the master CV.

3

Tailor

A CV rewritten per role, with the diff shown.

4

Approve

Swipe right, and it goes out. That's the user's whole job.

The core flow

features/jobs · features/approval · features/job_detail

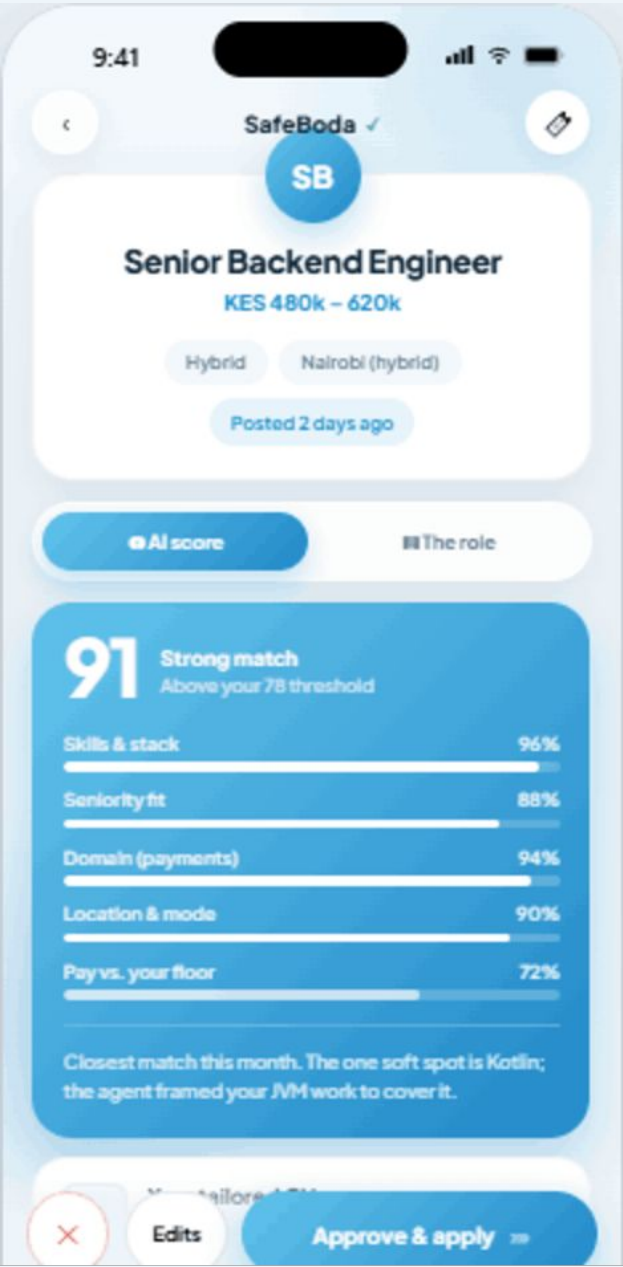

Home feed

Reminder, search, filters, then what needs a yes today.

Triage

Drag right to approve, left to pass — or switch to batch select.

Job detail

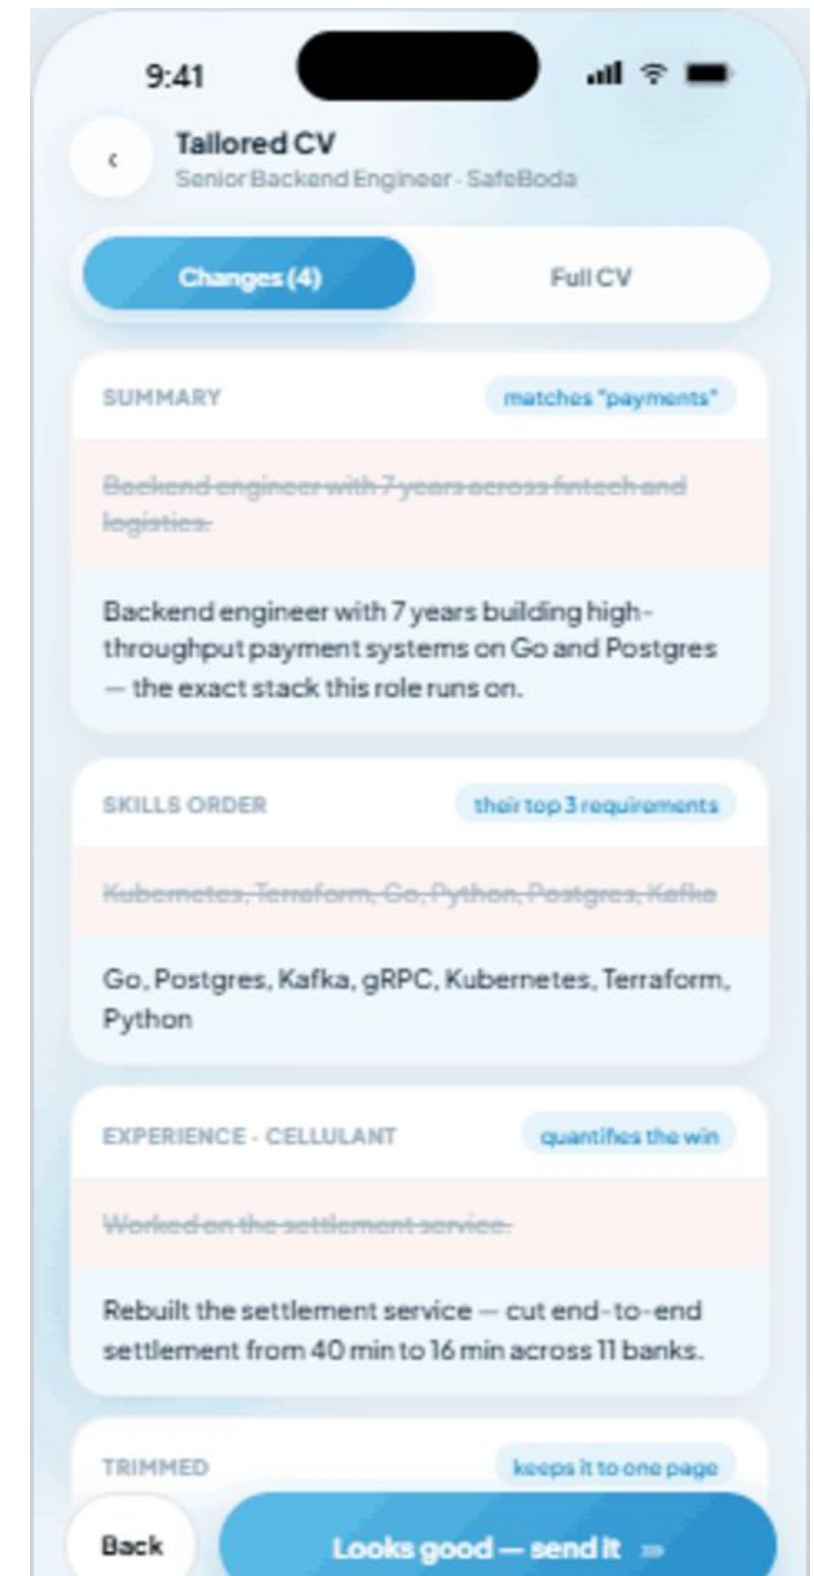

The score, broken into five axes, and the verdict in plain words.

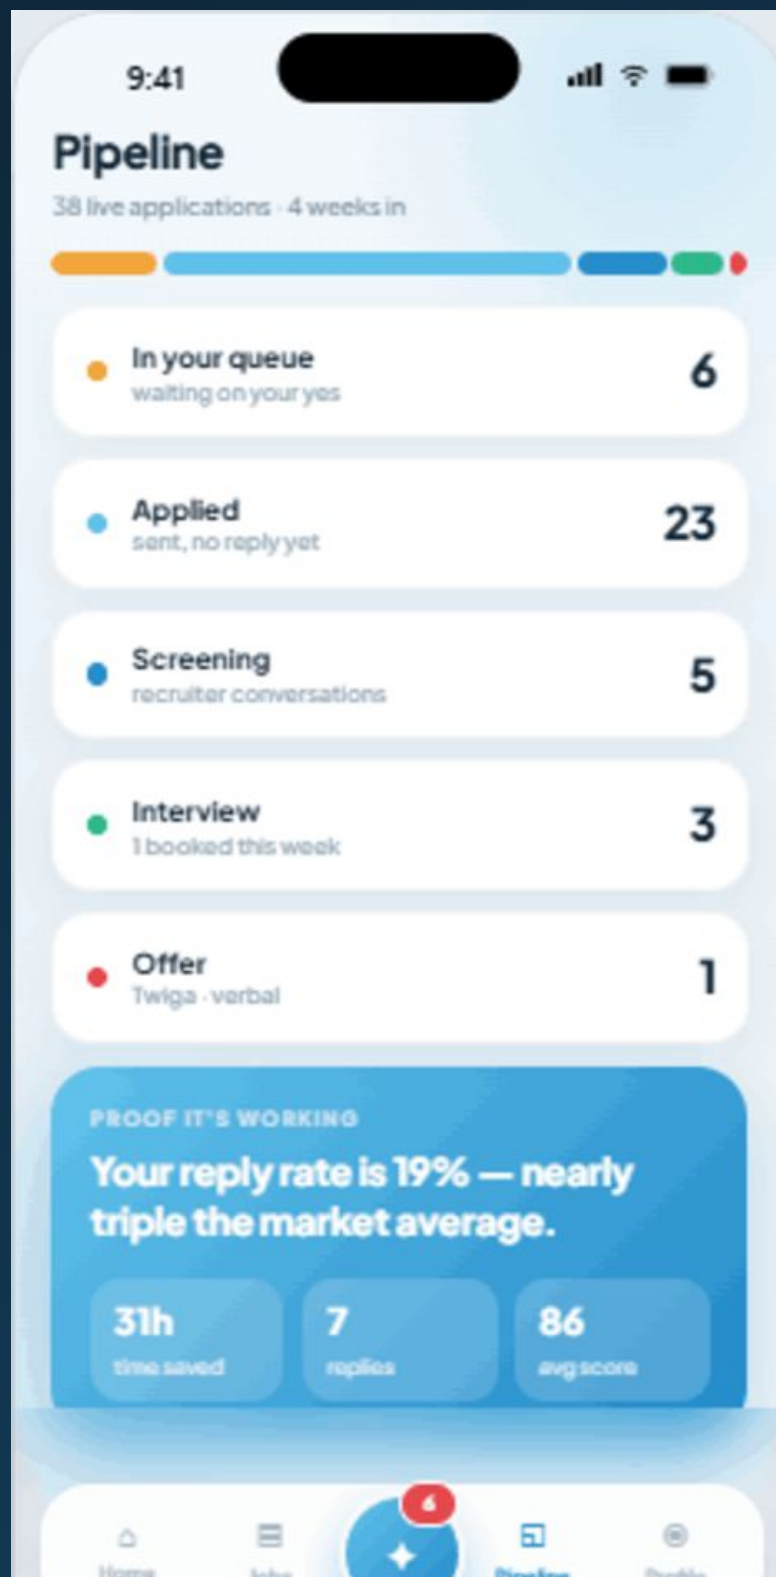

THE HARD PART

The agent has to show its work.

Nobody hands over their job search to a black box.
So the score is never just a number, and no CV edit
is silent.

- 1 **Five axes, always visible.** Skills, seniority, domain, location, pay — with the weak one called out.
- 2 **Every edit, with its reason.** Struck-through before, highlighted after, and why it changed.
- 3 **A third option.** Not just yes or no — "ask for edits" sends it back to the agent.

FEATURES/DASHBOARD

Proof, not vanity metrics.

One bar for the whole funnel, five stage rows underneath, and a single honest headline number.

Steering the agent

features/profile

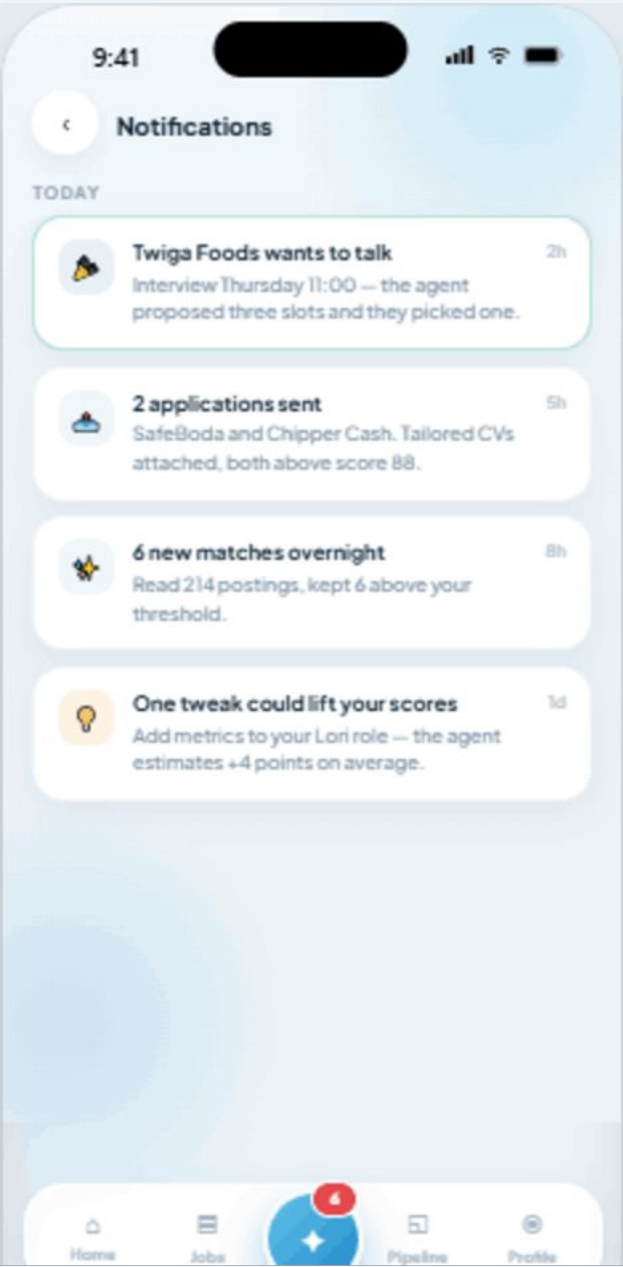

Master CV

Strength scored, with the one change that would lift every match.

Threshold

The dial predicts its own consequence: "about 6 a day."

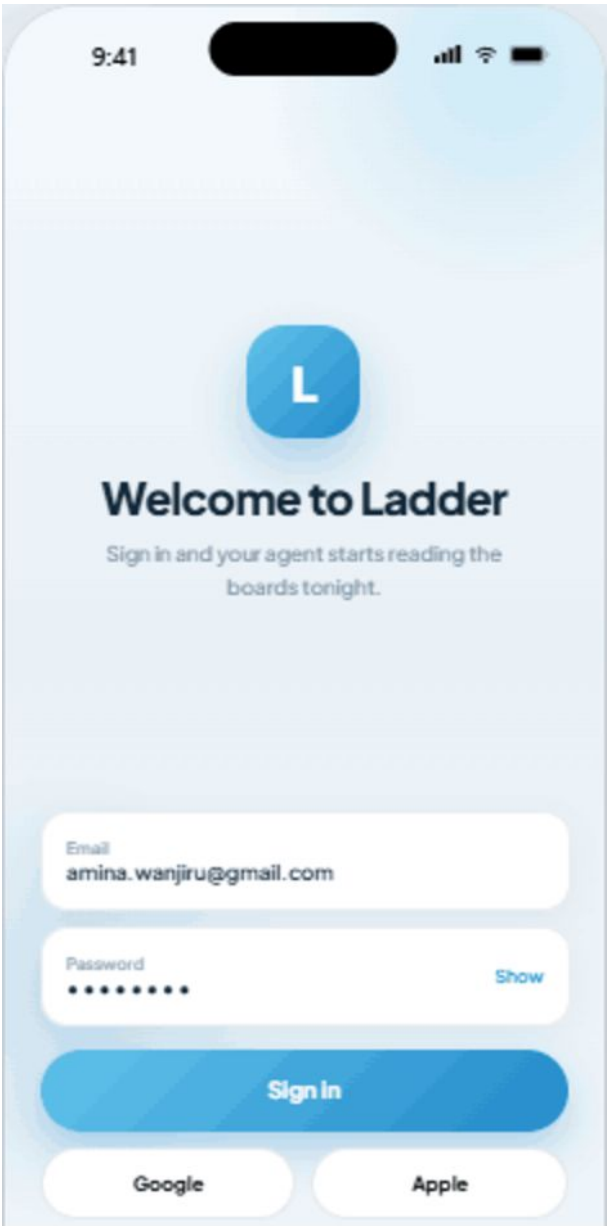

Notifications

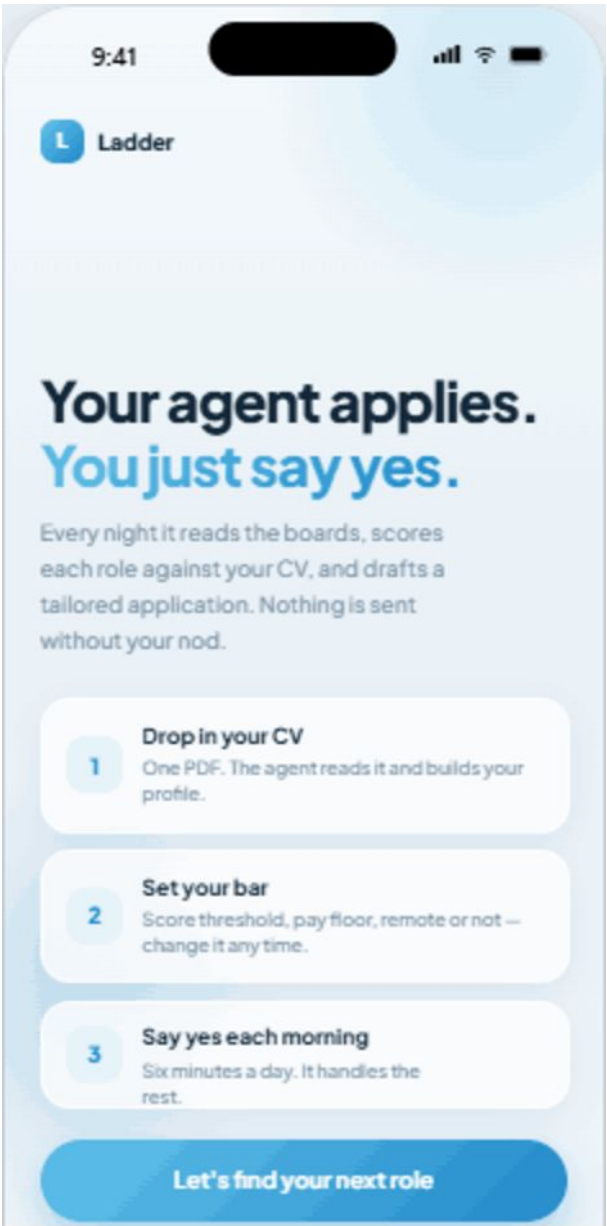

Wins first, then sends, then a coaching nudge.

NEXT

Three things I'd build next.

Company profile

The other tab on job detail — team, reviews, other open roles.

Android pass

Material navigation, back behaviour, and the same system re-tuned.

Dark mode

The ink palette already exists — it needs the glass surfaces inverted.
